

**IN THE CLAIMS:**

Please amend the claims as follows:

Claim 1 (Currently Amended): A display control apparatus comprising:

an opening device for placing a display device received in a receiving device in an active state thereof;

a detection device for detecting whether or not the display device is placed in the active state; and

an output device for ~~[[,]] when it is detected that the display device has been placed in the active state~~ ~~[[,]]~~ outputting a video signal to be displayed on the display device to the display device ~~so that~~ to cause the display device ~~starts~~ to display video based on the video signal; and

an operation device through which a command to display the video on the display device is given by an input operation.

wherein:

when the command is given by the input operation to display the video while the display device is being placed in the active state, the output device starts to output the video signal only after detection by the detection device that the display device has completely reached the active state.

Claim 2 (Currently Amended): A display control apparatus comprising:

a display device capable of being in an active state to display video;

a detection device for detecting whether or not display of the video is completed for all video; and

a receiving control device for placing the display device in the ~~active~~ inactive state in a receiving device when it is detected that the display of all the video has been completed.

Claim 3 (Currently Amended): The display control apparatus of ~~[[of]]~~ claim 1 or 2, wherein the active state is a state at which the display device is placed so that the video displayed on the display device is visible.

Claim 4 (Currently Amended): A display control method comprising the steps of:  
placing a display device received in a receiving device in an active state thereof;  
detecting whether or not the display device is placed in the active state; ~~and~~  
outputting~~[[,]]~~ ~~when it is detected that the display device has been placed in the active~~  
~~state[[,]]~~ a video signal to be displayed on the display device to the display device ~~so that to~~  
cause the display device ~~starts~~ to display video based on the video signal; and  
giving a command to display the video on the display device;  
wherein:  
when the command is given to display the video while the display device is being placed  
in the active state, the outputting step starts to output the video signal only after detection that the  
display device has completely reached the active state.

Claim 5 (Original): A display control method comprising the steps of:

detecting whether or not display of all video has been completed by display device under an active state; and

controllably receiving the display device in a receiving device so as to be placed in an inactive state from the active state, when it is detected that the display of all video has been completed.

Claim 6 (Original): The display control method of claim 4 or 5, wherein the active state is a state at which the display device is placed so that the video displayed on the display device is visible.

Claim 7 (Currently Amended): An information recording medium in which a display control program is recorded readably by a computer included in a display control apparatus, the display control program causing the computer to serve as:

an opening device for placing a display device received in a receiving device in an active state;

a detection device for detecting whether or not the display device is placed in the active state; and

an output device for[[,]] ~~when it is detected that the display device has been placed in the active state~~[[,]] outputting a video signal to be displayed on the display device to the display device ~~so that~~ to cause the display device ~~starts~~ to display video based on the video signal; and

an operation device through which a command to display the video on the display device is given by an input operation,

wherein:

when the command is given by the input operation to display the video while the display device is being placed in the active state, the output device starts to output the video signal only after detection by the detection device that the display device has completely reached the active state.

Claim 8 (Original): An information recording medium in which a display control program is recorded readably by a computer included in a display control apparatus, the display control program causing the computer to serve as:

a detection device for detecting whether or not display of all video has been completed by a display device to display the video under an active state; and

a receiving control device for controllably receiving the display device in a receiving device so as to be placed in an inactive state from the active state, when it is detected that the display of all video has been completed.

Claim 9 (Original): The information recording medium of claim 7 or 8, wherein the active state is a state at which the display device is placed so that the video displayed on the display device is visible.
